

[SIGNAL ADAPTOR]

Abstract

A signal adaptor is described. The signal adaptor comprises a fastening member, comprising a buckling portion and a tube extending from a rear side of said securing member; a nut, for fitting the fastening member; a receiving member having a buckling set formed on an outer contacting portion, for fitting onto the fastening member to tightly fasten the receiving member to the securing portion of the fastening member; and a securing member having a buckling set at an inner contacting portion, wherein when securing member is fitted around the receiving member, said buckling set of the contacting portion of the securing member buckles into the buckling set of the contacting portion of the receiving member for positioning said securing member onto the receiving member.
